The composition can be used to affect a biological process characterized by abnormal cell migration through a physiological barrier, where the process is selected from anglogenesis, organogenesis, ovulation, inflammation, cancer, tumor cell invasion and metastasis, and atherosclerosis.
This sequence represents human alpha-1-antitrysin c-terminal peptide fragment 6. Alpha-1-antitrypsin is a known inhibitor of serine proteases, but loses its inhibitory activity due to a change in territary structure when cleaved by proteases such as leukocyte elastase. The cleaved alpha-1-antitrypsin molecules are cleared from the circulation through receptors in the liver and is accompanied by a depletion of extracellular cholesterol. The cause of this cholesterol depletion is due to an increase in the number of low density lipoprotein (LDL) receptors in liver cells which take up the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Alpha-1-antitrypsin; fragment; low density lipoprotein; LDL; latherosclerosis; gallstone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence

This invention takes advantage of the fact that there is an increase in LDL receptor levels induced by the presence of cleaved alpha-1-antitrypsin and it derlyatives, including C-terminal peptide fragments. The C-terminal peptide fragments (AAY42733-Y42749) can be used to reduce the levels of LDL cholesterol in a patient and can be used to treat a wide variety of disorders, including atherosolerosis, hypercholesterolaemia and gallstones. As the peptides are derived from a naturally occurring human serum protein, they should not produce immune
The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various dispraces. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or
                                                                                                                                                                                                                                                                                                                                                                                                                   17-MAY-1999;

The mutant PAI-1 is used to prevent reocclusion. It binds to vitronectin to act as a strong thrombin inhibitor, but is much less effective as a PA inhibitor. See also AARI1755 and AARI2162-3.

This sequence comprises mature PAI-1 in which residues 344-349 (1.e.SerAlaArgMetAlaPro) in the reactive centre has been replaced by AlaGlyArgSerLeuAsn from the corresponding site of ATII. The mutant PAI-1 is used to prevent reocclusion. It binds to vitronectin to act as a strong thrombin inhibitor, but is much less effective
                                                                                New plasminogen activator i region of antithrombin III thrombolytic therapy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SSSS
human plasminogen activator inhibitor (PAI-1) mature protein (see also AAW31587). It has an Ala for Arg substitution at amino acid cresidue 346, i.e. in the reactive centre loop of the protein. The mutant can be obtained by site-directed mutagenesis of PAI-1 DNA (see AAM797303) and expression in a host cell. Claimed PAI-1 mutants (see AAM797303) and expression in a host cell. Claimed PAI-1 mutants (see AAM797303) and expression in a host cell. Claimed PAI-1 mutants (see AAM797302) and expression in a host cell. Claimed PAI-1 mutants (see AAM797303) and sepecially at position 343 and/or 346, and may have additional stabilising mutantions comprising between one and four of His-50, Thr-154, Leu-319 and Ile-354, and one or more of Arg-333, Arg-335, Cly-331, Ile-372 and Leu-91. The mutants are characterised by being resistant to inactivation by elastase, plasminogen activator, plasmin, cathepsin G, chymase, gelatinases A and B, stromelysin and collagenase, and by having a high affinity tand the protection of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            respiratory distress syndrome, acute lung inflammation, congenital alpha l-antitrypsin deficiency, cystic fibrosis, atopic dermatitis, periodontal disease, arthritis and HIV infection). They also inhibit Vn-stimulated cell attachment, migration and/or migration-induced proliferation (specifically in atherosclerosis, post-angioplasty restenosis, neointima formation after vascular trauma, vascular graft restenosis, fibrosis (associated with chronic inflammation or chemotherapy, or of the lung), wound healing with scarring and fibrosis, growth/invasion of primary tumours or metastases, psoriasis, deep vein thrombosis and any condition involving pathological angiogenesis (all claimed). Since the mutants are resistant to cleavage by the proteases to which the utants are more effective therapeutic agents. They also promote uptake and clearance of elastase (or its complex with PAI-1).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cc human plasminogen activator inhibitor (PAI-1) mature protein (see also AAW31587). It has a Val for arg substitution at amino acid cresidue 346, i.e. in the reactive centre loop of the protein. The mutant can be obtained by site-directed mutagenesis of PAI-1 DNA (see AAW25710-25) have at least one amino acid substitution at amino acid (see AAW25710-25) have at least one amino acid substitution at comparison and axpression in a host cell. Claimed PAI-1 mutants (see AAW25710-25) have at least one amino acid substitution at comparison by elasticon at comparison between one amino acid substitution at comparison between one amino comparison between one amino comparison between one amino comparison between one amino comparison by elasticon at comparison between one amino comparison by elasticon at comparison by elasticon activation by elasticon by elasticon by elasticon by elasticon comparison by elasticon activation by elasticon activation by elasticon comparison by elasticon activation by elasticon, and activation of comparison and activation and collagenase, and by having a high affinity comparison deficiency, cystic fibrosis, atopic dermatitis, crispiancy distress syndrome, acute lung inflammation, congenital comparison, activation and acti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC this polypeptide comprises a preferred mutant, PiGly (R346G), of Cd human plasminogen activator inhibitor (PAI-1) mature protein (see also AAW31587). It has a Gly for Arg substitution at amino acid CC residue 346, i.e. in the reactive centre loop of the protein. The CR mutant can be obtained by site-directed mutaqenesis of PAI-1 DNA CS (see AAP37303) and expression in a host cell. Claimed PAI-1 mutants CC (see AAW26710-25) have at least one amino acid substitution at position 343-350, especially at position 343 and/or 346, and may CC (see AAW26710-25) have at least one amino acid substitution at CC (see AAW26710-25) have at least one amino acid substitution at CC (see AAW26710-25) have at least one amino acid substitution at CC (see AAW26710-25) have at least one amino acid substitution at CC (see AAW26710-25) have at least one amino acid substitution at CC (see AAW26710-25) have at least one amino acid substitution at CC (see AAW26710-25) have at least one amino acid substitution at CC (see AAW26710-25) have at least one amino acid substitution at CC (see AAW26710-25) have at least one amino acid substitution between one and CC (see AAW26710-25) have at least to inactivation by elastase, CC (see AAW26710-25) have at least to collagenase, and by having a high affinity of vironase, gelatinases A CC (see AAW26710-25) have acid viry (specifically in emphysema, adult respiratory distress syndrome, acute lung inflammation, congenital CC panceratitis, periodontal disease, arthritis and HIV infection). They also inhibit vn-stimulated cell attachment, majoration and/or comparation involving pathological angiorential formation after vascular trauma, vascular graft restenosis, fibrosis (associated with CAPONIC inflammation or chemotherapy, or of the lung), wound condition involving pathological angiorential angiorents (aslociated with CAPONIC inflammation or chemotherapy, or of the lung), wound condition involving pathological angiorential angiorents and any condition involving pathological angiorential angiorents (as

CC This polypeptide comprises a preferred mutant, Plasp (R346D), of CC human plasminogen activator inhibitor (PAI-1) mature protein (see also AAW31887). It has an Asp for Arg substitution at amino acid CC residue 346, i.e. in the reactive centre loop of the protein. The mutant can be obtained by site-directed mutagenesis of PAI-1 DNA CC (see AAW19730) and expression in a host cell. Claimed PAI-1 mutants (see AAW19730) and expression in a host cell. Claimed PAI-1 mutants (see AAW26710-25) have at least one amino acid substitution at comprising between one and CC four of His-150, Thr-154, Leu-319 and Ine-354, and one or more of CC characterised by being resistant to inactivation by elastase, and a stromelysin and collagenase, and by having a high affinity CC plasminogen activator, plasmin, cathepsin G, chymase, gelatinases A CC and B, stromelysin and collagenase, and by having a high affinity CC pathological elastase activity (specifically in emphysema, adult CC apha 1-antitrypsin deficiency, cystic fibrosis, atopic dermatitis, CC pancreatitis, periodonntal disease, restrictive and HIV infection), They also inhibit Vn-stimulated cell attachment, migration and/or Migration-induced proliferation (specifically in atherosclerosis, CC migration-induced proliferation (specifically in atherosclerosis, CC migration inflammation or chemotherapy, or of the lung), would the chronic inflammation or chemotherapy, or of the lung) would chaling with scarring and fibrosis, fibrosis (associated with CC trauma, vascular graft restenosis, floresis (associated with CC thronic inflammation or chemotherapy, or of the lung), would healing with scarring and fibrosis, growth/invasion of primary condition involving pathological angiogenesis (all claimed). Since the mutants are resistant to cleavage by the proteases to which they are more effective therapeutic agents. They also with path in the pathological angiogenesis (all claimed).
                                         by receptors.

(NB. the amino acid sequence of the mutant protein was obtained by adaptation of the wild-type sequence provided in Fig 4A of the specification).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Plasminogen activator-inhibitor type I mutant inhibits elastase - has high affinity for vitronectin, for therapeutic inhibition of elastase or vitronectin-mediated cell attachment, migration etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Plasminogen activator inhibitor type 1; PAI-1; human; elastase; inhibitor; vitronectin; cell attachment; cell migration cell proliferation; emphysema; adult respiratory distress syndrom acute lung inflammation; alpha 1-antitrypsin deficiency; cystic fibrosis; atopic dermatitis; pancreatitis; periodontal disease; arthritis; HY; atherosclerosis; restenosis; periodontal disease; arthritis; HY; atherosclerosis; propositions; wound healing; tumour; metastasis; psoriasis

CC This polypeptide comprises a preferred mutant, P4Ala (V343A), of CC human plasminogen activator inhibitor (PAI-1) mature protein (see CI also AAW31587). It has an Ala for Val substitution at amino acid CC residue 343, i.e. in the reactive centre loop of the protein. The mature amino acid commutant can be obtained by site-directed mutagenesis of PAI-1 DNA CC (see AAW26710-25) have at least one amino acid substitution at position 343-350, especially at position 343 and/or 346, and may CC have additional stabilising mutations comprising between one and CC four of His-150, Thr-154, Leu-319 and Ile-354, and one or more of CC Arg-333, Arg-333, Gly-331, Ile-372 and Leu-91. The mutants are CC plasminogen activator, plasmin, cathepsin G, chymase, gelatinases A CC and B, stromelysin and collagenase, and by having a high affinity CC for vitronectin (vn) and are used, in vivo or in vitro, to inhibit CC respiratory distress syndrome, actuel lung inflammation, congenital CC alpha 1-antitrypsin deficiency, cystic fibrosis, atopic dermatitis, periodontal disease, arthritis and HIV infection). They also inhibit Vn-stimulated cell attachment, migration and/or majoration-induced proliferation (specifically in atherosclerosis, CC trauma, vascular graft restenosis, fibrosis (associated with cc chronic inflammation or chemotherapy, or of the lung), wound cc healing with scarring and fibrosis, growth/invasion of primary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁

Si the mutants are resistant to cleavage by the proteases to which they bind, they are more effective therapeutic agents. They are promote uptake and clearance of elastase (or its complex with PI by receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Plasminogen activator inhibitor type 1; PAI-1; human; elastase; inhibitor; vitronectin; cell attachment; cell migration; cell proliferation; emphysema; adult respiratory distress syndrome; acute lung inflammation; alpha 1-antitrypsin deficiency; acute fibrosis; atopic dermatitis; pancreatitis; periodontal disease; arthritis; HIV; atherosclerosis; restenosis; periodontal disease; arthritis; HIV; atherosclerosis; restenosis; neointima; fibrosis; wound healing; tumour; metastasis; psoriasis;
This polypeptide comprises a preferred mutant, P4Asp (V343D), of human plasminogen activator inhibitor (PAI-1) mature protein (see also AAW31587). It has an Asp for Val substitution at amino acid residue 343, i.e. in the reactive centre loop of the protein. The mutant can be obtained by site-directed mutagenesis of PAI-1 DNA (see AAW3973D3) and expression in a host cell. Claimed PAI-1 mutants (see AAW3973D3) and expression in a host cell. Claimed PAI-1 mutants position 343-350, especially at position 343 and/or 346, and may have additional stabilising mutations comprising between one and
                                                                                                                                                                                                                                                                                                                                                                       Plasminogen activator-inhibitor type I mutant inhibits elastase - has high affinity for vitronectin, for therapeutic inhibition of elastase or vitronectin-mediated cell attachment, migration etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI;
                                                                                                                                                                                                                                                                                                                 Claim

CC Arg-333, Arg-335, Gly-331, Ile-372 and Leu-91. The mutants are CC characterised by being resistant to inactivation by elastase, CC plasminogen activator, plasmin, cathepsin G, chymase, gelatinases A CC and B, stromelysin and collagenase, and by having a high affility CC for vitronectin (Vn) and are used, in vivo or in vitro, to inhibit CP pathological elastase activaty (specifically in emphysema, adult respiratory distress syndrome, acute lung inflammation, congenital CC alpha 1-antitrypsin deficiency, cystic fibrosis, atopic dermatitis, particularly also inhibit Vn stimulated cell attachment, migration and/or migration-induced proliferation (specifically in atherosclerosis, congenital constrainty of the strainty vascular graft restenosis, neointime formation after vascular trauma, vascular graft restenosis, fibrosis (associated with Cc chronic inflammation or chemotherapy, or of the lung), wound changing with scarring and fibrosis, growth/invasion of primary condition involving pathological angiogenesis (all claimed). Since the budd, they are more effective therapeutic agents. They also promote uptake and clearance of elastase (or its complex with PAI-1) by receptors.

(NB. the amino acid sequence of the mutant protein was obtained by adeptation of the wild-type sequence provided in Fig 4A of the matches 6; Conservative 0; Mismatches 0; Indels 0; Gaps 0; Best Local Smilarity 100.0%; Score 29; DB 18; Length 379; Matches 6; Conservative 0; Mismatches 0; Indels 0; Gaps ob time: 365 sec

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score

A; Molecule type: protein
A; Residues: 370-375 <370
C; Comment: This inhibitor acts as "bait" for tissue plasminogen activator (see PIR:UKHUT)
C; Comment: This inhibitor acts as "bait" for tissue plasminogen activator (see PIR:UKHUT)
C; Comment: Three types of PAI have been identified (see also PIR:A32853 and PIR:A39339);
oma cells. Vascular endothelial cells may be the primary site of synthesis of plasma PAI
C; Comment: Glycosylation is not required for inhibitory activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A; Molecule type: mRNA
